

## The Internet

- is the largest computer network in the world
- most of the Internet traffic is handled by the Internet Protocol (IP) and the Transmission Control Protocol (TCP)
- the evolution of TCP is still ongoing and there exist a variety of different TCP algorithm variants

## The INET Framework for OMNeT++

- includes IP-based simulation models e.g. IP, UDP, TCP, SCTP

## The TCP Module

- used a fixed TCP header length of 20 bytes and options (e.g. SACK) were not supported
- The **SACK option** is part of common TCP implementations and is – according to RFC 4614 – a "recommended enhancement" for TCP
- The following **Flow Control** related parts were missing:
  - A finite receive buffer size was not modelled
  - The data receiver was always offering the maximum receiver Window size
  - The data receiver was not able to send a Zero Window
  - The Persist Timer was missing
  - A function to send a Window Probe was implemented but has never been invoked

## Header Extension

- Segment format has been changed to support **TCP options**

## SACK Option

- Only if both nodes send a **SACK Permitted** option during connection setup, SACK (RFCs 2018, 2883) will be enabled
- **SACK-based Loss Recovery** algorithm (RFC 3517) has been integrated into TCPReno

## Flow Control Enhancements

- Added missing parts of the **Flow Control** mechanism

## TCPDump Module (to capture PCAP files)

- has been extended to convert the TCP segment format of INET (including the newly implemented TCP options) from/to binary (network byte order) TCP segments

→ Allows for **TCP signalling analyses** with external tools

## ExtInterface Module (to connect network nodes)

- has been extended to support TCP communications

→ Supports **connecting the TCP module with real, external TCP implementations**

## Further Enhancements

- RFC 3042 – **Limited Transmit** (Loss Recovery algorithm)
- RFC 3390 – Increasing TCP's **Initial Window**
- RFC 3782 – **NewReno** (Loss Recovery algorithm)

## Motivation

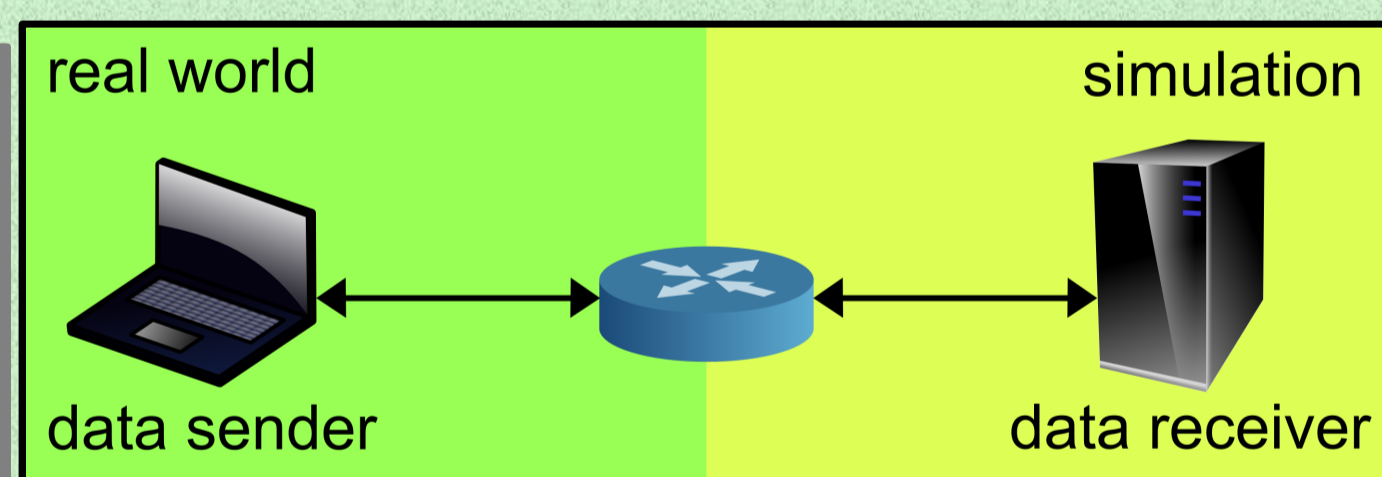

# TCP Module

## Enhancements

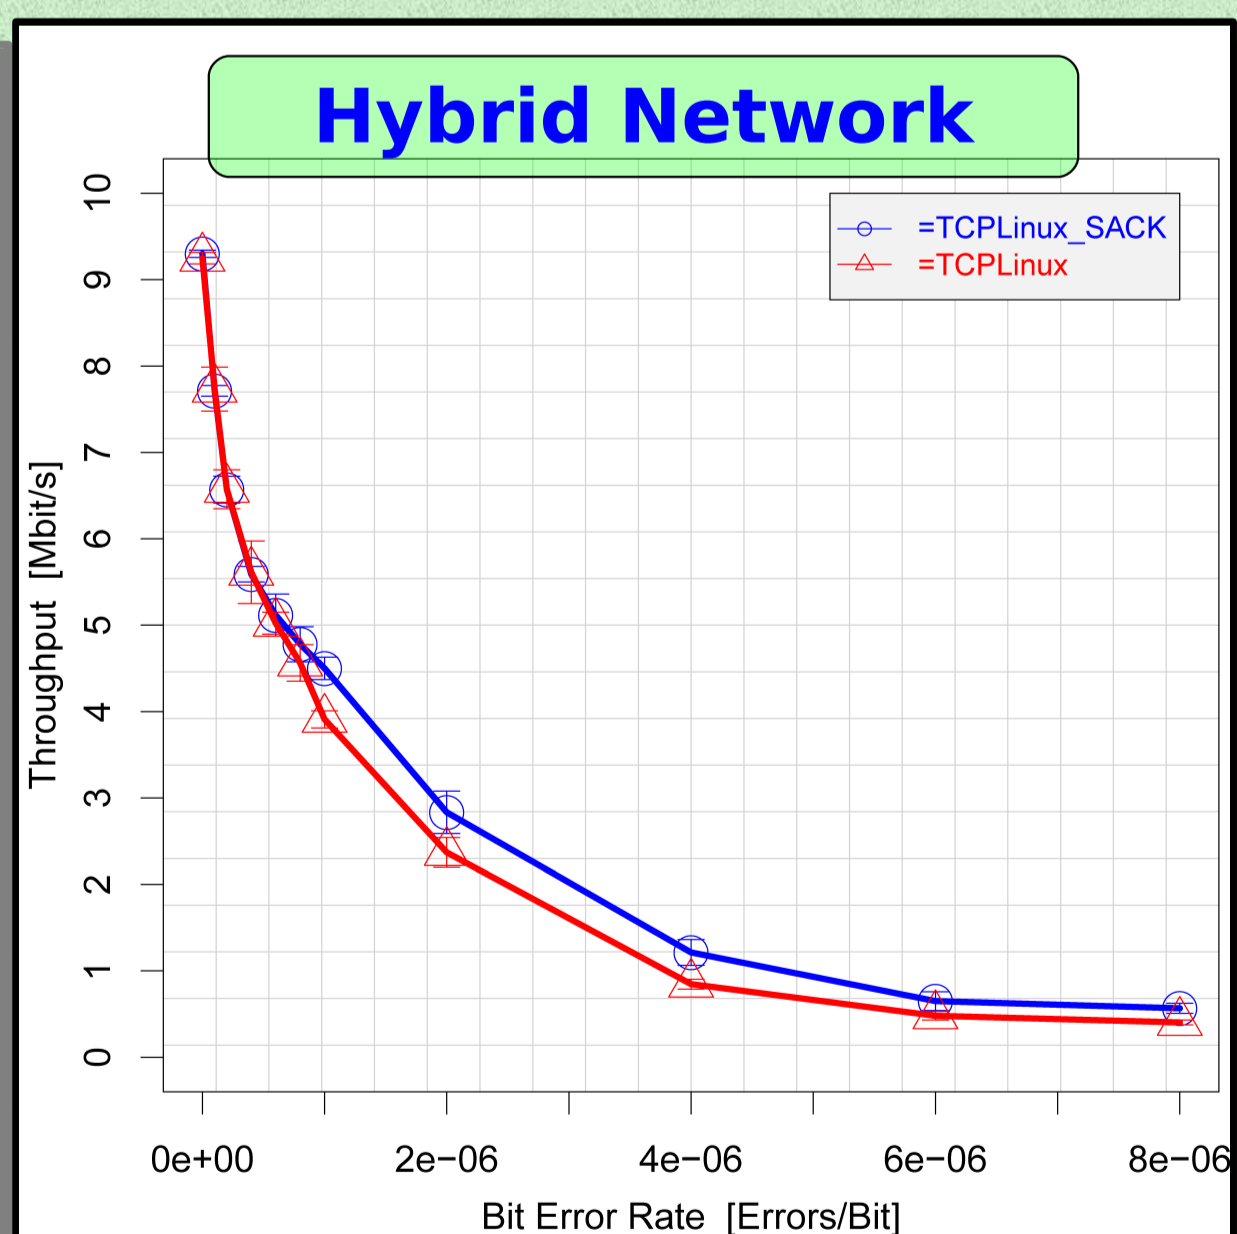

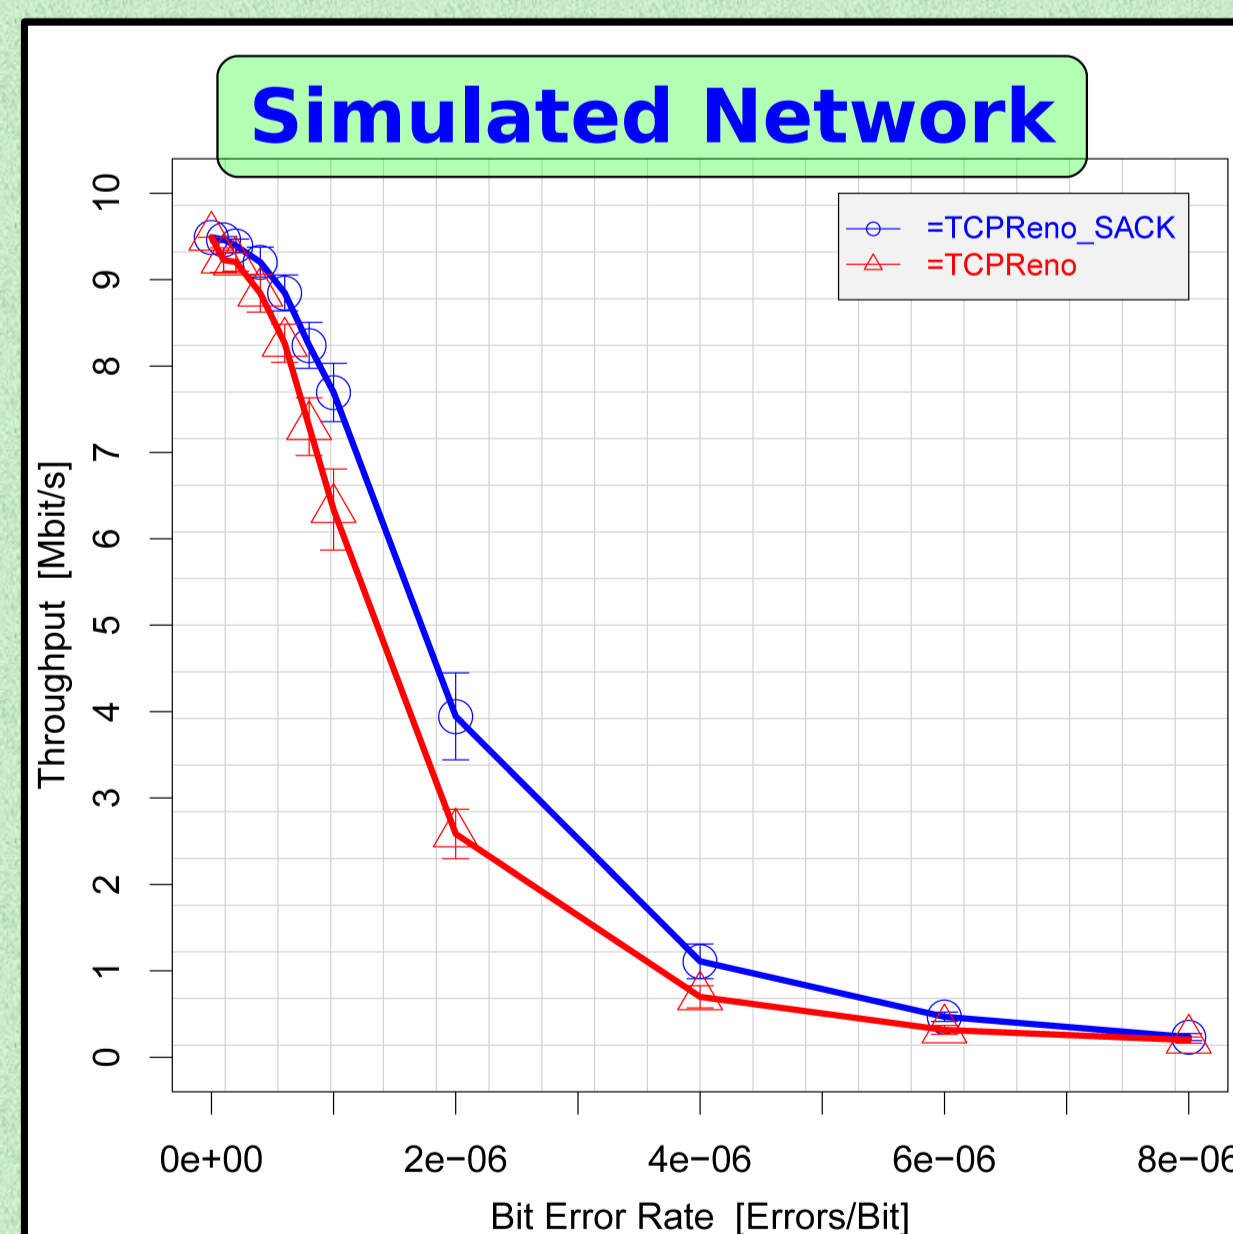

## Performance

### Network setup

- MTU = 1500B
- MSS = 1452B
- user data = 100MiB
- test duration = 60s
- data rate = 10Mbit/s
- delay = 0.565µs
- **bit error rate = variable**

### Simulation results

Bit Error Rate

## Interoperability

- **Captured TCP signalling logs** demonstrate the interoperability of the enhanced TCP module with real TCP implementations (e.g. Linux)

```
No.  Time      Source          Destination      Protocol  Info
1 0.000000 192.168.0.111   172.0.1.111     TCP      45315 > 10021 [SYN] Seq=0 win=5808 Len=0 MSS=1452 TSV=3226577 TSEQ=0
2 0.007217 172.0.1.111    192.168.0.111   TCP      10021 > 45315 [SYN, ACK] Seq=0 Ack=1 win=65535 Len=0 MSS=1452
3 0.007263 192.168.0.111  172.0.1.111    TCP      45315 > 10021 [ACK] Seq=1 Ack=1 win=5808 Len=0

> Flags: 0x12 (SYN, ACK)
window size: 65535
checksum: 0xc838 [correct]
Options: (8 bytes)
Maximum segment size: 1452 bytes
NOP
NOP
SACK permitted
```

- The SYN,ACK segment contains a **SACK-Permitted** option to enable SACK

```
No.  Time      Source          Destination      Protocol  Info
99 0.345918 172.0.1.111    192.168.0.111   TCP      10021 > 45315 [ACK] Seq=1 Ack=182977 win=65535 Len=0
100 0.247596 172.0.1.111    192.168.0.111   TCP      10021 > 45315 [ACK] Seq=1 Ack=185881 win=65535 Len=0
101 0.248681 172.0.1.111    192.168.0.111   TCP      [TCP Dup ACK 100/1] 10021 > 45315 [ACK] Seq=1 Ack=185881 win=65535 L

> Flags: 0x10 (ACK)
window size: 65535
checksum: 0x973b [correct]
Options: (12 bytes)
NOP
NOP
SACK: 187333-188785
```

- Duplicate ACKs contain **SACK options** to allow TCP sender to recover more effectively when multiple segments are lost
- The enhanced TCP module has already been **integrated** into the INET framework and is **accessible** at:

<http://github.com/inet-framework/inet>

**Some important features of modern TCP implementations - particularly SACK and a complete Flow Control - have been added to INET's TCP module**

## Our Research

University of Duisburg-Essen

## Flow Routing

- Research
  - QoS Device Concept
- Contributions to Standardization
  - IETF (Flow Identification)
  - ITU-T and ETSI (QoS Signalling)

## SCTP

- Evaluation, Optimization and Improvement
  - Concurrent Multipath Transfer (CMT)
  - Performance and Security
- Open Source Implementation *SCTPLIB*
- Contributions to IETF Standardization
  - Secure-SCTP (Individual Submission)
  - TLS over SCTP (RFC 3436)

## RSerPool

- Evaluation, Optimization and Improvement
- Various Contributions to Major Conferences
- Open Source Implementation *RSPLIB*
- Contributions to IETF Standardization
  - RFC 5351, RFC 5356, RFC 5525
  - Multiple Internet Drafts
